The Stages of Change
The stages of change are:
- Precontemplation (Not yet acknowledging that there is a problem behavior that needs to be changed)
- Contemplation (Acknowledging that there is a problem but not yet ready or sure of wanting to make a change)
- Preparation/Determination (Getting ready to change)
- Action/Willpower (Changing behavior)
- Maintenance (Maintaining the behavior change) and
- Relapse (Returning to older behaviors and abandoning the new changes)

Stage One: Precontemplation
In the precontemplation stage, people are not thinking seriously about changing and are not interested in any kind of help. People in this stage tend to defend their current bad habit(s) and do not feel it is a problem. They may be defensive in the face of other people’s efforts to pressure them to quit.

They do not focus their attention on quitting and tend not to discuss their bad habit with others. In this stage people just do not yet see themselves as having a problem.

Stage Two: Contemplation
In the contemplation stage people are more aware of the personal consequences of their bad habit and they spend time thinking about their problem. Although they are able to consider the possibility of changing, they tend to be ambivalent about it.

In this stage, people are on a teeter-totter, weighing the pros and cons of quitting or modifying their behavior. Although they think about the negative aspects of their bad habit and the positives associated with giving it up (or reducing), they may doubt that the long-term benefits associated with quitting will outweigh the short-term costs.

It might take as little as a couple weeks or as long as a lifetime to get through the contemplation stage. (In fact, some people think and think and think about giving up their bad habit and may die never having gotten beyond this stage)
On the plus side, people are more open to receiving information about their bad habit, and more likely to actually use educational interventions and reflect on their own feelings and thoughts concerning their bad habit.
Stage Three: Preparation/Determination
In the preparation/determination stage, people have made a commitment to make a change. Their motivation for changing is reflected by statements such as: “I’ve got to do something about this — this is serious. Something has to change. What can I do?” This is sort of a research phase: people are now taking small steps toward cessation. They are trying to gather information (sometimes by reading things like this) about what they will need to do to change their behavior.

Too often, people skip this stage: they try to move directly from contemplation into action and fall flat on their faces because they haven’t adequately researched or accepted what it is going to take to make this major lifestyle change.

Stage Four: Action/Willpower
This is the stage where people believe they have the ability to change their behavior and are actively involved in taking steps to change their bad behavior by using a variety of different techniques.

This is the shortest of all the stages. The amount of time people spend in action varies. It generally lasts about 6 months, but it can literally be as short as one hour! This is a stage when people most depend on their own willpower. They are making overt efforts to quit or change the behavior and are at greatest risk for relapse. Mentally, they review their commitment to themselves and develop plans to deal with both personal and external pressures that may lead to slips. They may use short-term rewards to sustain their motivation, and analyze their behavior change efforts in a way that enhances their self-confidence. People in this stage also tend to be open to receiving help and are also likely to seek support from others (a very important element). Hopefully, people will then move to:

Stage Five: Maintenance
Maintenance involves being able to successfully avoid any temptations to return to the bad habit. The goal of the maintenance stage is to maintain the new status quo. People in this stage tend to remind themselves of how much progress they have made.

People in maintenance constantly reformulate the rules of their lives and are acquiring new skills to deal with life and avoid relapse. They are able to anticipate the situations in which a relapse could occur and prepare coping strategies in advance. They remain aware that what they are striving for is personally worthwhile and meaningful. They are patient with themselves and recognize that it often takes a while to let go of old behavior patterns and practice new ones until they are second nature to them. Even though they may have thoughts of returning to their old bad habits, they resist the temptation and stay on track. As you progress through your own stages of change, it can be helpful to re-evaluate your progress in moving up and down through these stages.

(Even in the course of one day, you may go through several different stages of change).

And remember: it is normal and natural to regress, to attain one stage only to fall back to a previous stage. This is just a normal part of making changes in your behavior.
<table>
<thead>
<tr>
<th>Stage of Change</th>
<th>Characteristics</th>
<th>Techniques</th>
</tr>
</thead>
</table>
| Pre-contemplation | Not currently considering change: "Ignorance is bliss" | Validate lack of readiness.  
Clarify: decision is theirs  
Encourage re-evaluation of current behavior  
Encourage self-exploration, not action  
Explain and personalize the risk |
| Contemplation    | Ambivalent about change: "Sitting on the fence"  
Not considering change within the next month | Validate lack of readiness  
Clarify: decision is theirs  
Encourage evaluation of pros and cons of behavior change  
Identify and promote new, positive outcome expectations |
| Preparation      | Some experience with change and are trying to change: "Testing the waters"  
Planning to act within 1 month | Identify and assist in problem solving re: obstacles  
Help patient identify social support  
Verify that patient has underlying skills for behavior change  
Encourage small initial steps |
| Action           | Practicing new behavior for 3-6 months | Focus on restructuring cues and social support  
Bolster self-efficacy for dealing with obstacles  
Combat feelings of loss and reiterate long-term benefits |
| Maintenance      | Continued commitment to sustaining new behavior  
Post-6 months to 5 years | Plan for follow-up support  
Reinforce internal rewards  
Discuss coping with relapse |
| Relapse          | Resumption of old behaviors: "Fall from grace" | Evaluate trigger for relapse  
Reassess motivation and barriers  
Plan stronger coping strategies |
